目 次

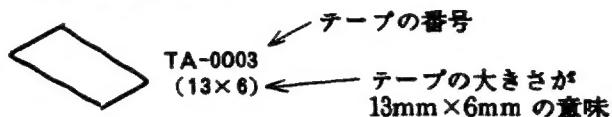

1. 仕 様	M1 ~ M19
2. 実体配線図	E1
3. 回路図	E2
4. メインFPC電気部品配置図	E3
5. 展開図	F1 ~ F14
6. 部品表	P1 ~

CONTENTS

1. Specifications	M1 ~ M19
2. Wiring Diagram	E1
3. Circuit Diagram	E2
4. MAIN FPC Electric parts locations	E3
5. Exploded Drawings	F1 ~ F14
6. Parts List	P1 ~

注 意 事 項

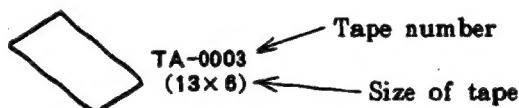

1. 展開図の中で使われているテープの番号（例：TA-0003）は、配布済みのサービス技報（No. 88-12号）を参照のこと。
2. テープの番号の下にある数字 例：(13×6) はテープの大きさを表している。単位は mm

3. コード整理用テープの貼付け箇所は現品参照のこと。

NOTE :

1. Refer to the technical information already sent as for the number of the tapes (ex. TA-0003) used in the exploded drawings.
2. Numbers (ex. 13×6) described under the tape numbers are sizes of the tapes. (Unit: mm)

3. Refer to the camera as to the position of tapes for arrangement of lead wires.

SPECIFICATIONS

1. Outline

Name:

Nikon F-401s (FAA21052)

Nikon F-401s QUARTZ DATE (FAA21252)

Nikon N4004s (FAA21152) * for North America

Purpose:

F-401s/N4004s has been developed in order to enhance the competitive power in the market by further improving the F-401/N4004.

Difference from
F-401/N4004:

- (1) Advanced AM200 is employed as an AF sensor.
- (2) AF metering range: EV-1 ~ EV17
- (3) A, L and S positions on aperture dial and shutter speed dial are locked.
- (4) Letters on dials are larger and acryl cover is clearer to improve the visibility.
- (5) Shutter release button is taller and its shape is same as that of F-801/N8008 to make the pre-release feeling clear.
- (6) Film advance signal and its window are modified.
- (7) Self-timer LED display is changed.
- (8) Nikon Logo and other parts are changed.

Features:

- (1) Built-in autofocus detection by phase-contrast detection system (advanced AM200)
- (2) New AF lenses focused by the AF motor in the camera
- (3) All information from the CPU in new AF lenses transmitted to the camera
- (4) Built-in auto TTL flash (External flash unit is also usable.)
- (5) Built-in AMP (for daylight flash and dim light flash firing)
- (6) Auto film advance and power rewind with a sequence motor
- (7) Easy-loading mechanism for automatic film loading
- (8) Four exposure metering modes available: P, S, A and M
In P mode, one of two program modes is automatically selected depending on the focal length of the lens in use.
- (9) TTL auto flash control possible
- (10) In P or S mode, program flash in which the camera automatically controls the aperture is possible.
- (11) Automatic film speed setting when DX-coded film is used
- (12) Capable of distance measurement by using AF illuminator when light intensity is low (with external flash SB-20, 22, 23 or 24)

2. Specifications

Type of camera: Lens interchangeable, autofocus 35mm single-lens reflex with built-in motor drive

Picture size: 24mm × 36mm

Usable film: Cartridge-type 35mm film (DX/non-DX-coded film)

Usable lens:

- (1) New AF Nikkor lenses with AF contacts
- (2) When lens without AF contacts is mounted:
 - a) Exposure indicator goes out.
 - b) Both focusing and flash indicators light up.
(but no light-insufficient warning)
 - c) Shutter release is possible. (but locked when shutter speed dial is set to A or aperture dial to S)

* Same as above when a lens is not mounted

Standard lens: New AF Nikkor lens 50mm F1.8 lens or New AF Zoom Nikkor 35-70mm F3.3-4.5 lens

Full aperture exposure compensation: CPU control system

Lens mount: Nikon F mount

Shutter: SEIKO MFD
Electronically controlled vertical travel focal-plane shutter
(2 Mg type), plastic shutter blades employed in combination with metal shutter blades

Exposure control mode:

- (1) Programmed exposure (P mode)
- (2) Shutter priority auto exposure (S mode)
- (3) Aperture priority auto exposure (A mode)
- (4) Manual exposure (M mode)

Electronic circuits:	(1) HD63B05Z	CPU
	(2) M51066	Decoder driver
	(3) M51063	Light metering IC
	(4) μ PD3581K	CCD
	(5) CXK1005	EEPROM
	(6) MB4436	CCD I / F

AF detection system: TTL distance metering is made by Nikon's own AM200 phase-contrast detection system. The electrical signal from 200 CCD line sensors (100×2) in the sensor module, which is in the same position as the film plane, but below the mirror, is converted from analog to digital data by CPU. According to the program, the CPU calculates digital data and outputs the focus difference from the focal plane as a predicted defocus value.

AF lens travel: AF lens is driven and focused by the AF motor in the camera through the coupling on the mount. AF lens can be driven by depressing the shutter release button halfway.

Servo mechanism: By comparing the output value from the digital encoder in the camera with a predicted defocus value calculated by the CPU, the new AF system drives the lens to correct focusing position and stops. As the lens comes closer to the correct focusing position, the lens driving speed of the motor slows down by four steps and the motor stops at the correct focusing point.

(1) AF servo mode In this mode, the AF lens driving stops once the subject is correctly focused. When depressing the shutter release button halfway, power is on and the AF lens is driven and stops when the subject is correctly focused. Unless the subject is correctly focused, the shutter cannot be released.

By removing the finger from shutter release button and depressing the button halfway once again, the AF lens is driven again and stops when correctly focused.

(2) Manual focus mode (focus assist mode) Focus assist mode (FA) which enable the operator to rotate the lens focusing ring manually referring to the focus indicator in the viewfinder without using autofocus. The focus indicator display does not disappear while the pre-release timer is activated. By turning the focus mode selector to M, manual focusing using the focusing ring becomes possible.

Mounting contacts: Electrical contacts on the upper inside of the body mount transmit signals from the lens to the body. Detailed usage of the contacts is as follows:

Usage	Contact A	B	C	D	E	F	G
AF lens	Vcc 1	R/W1	CLK	SI/SO			GND

Contacts A-G are arranged from left to right observed from the front of the body.

F number required for focus detection: F5.6 or larger

Brightness for focus detection: Approx. EV-1 ~ EV17 (at ISO 100 and normal temperature)

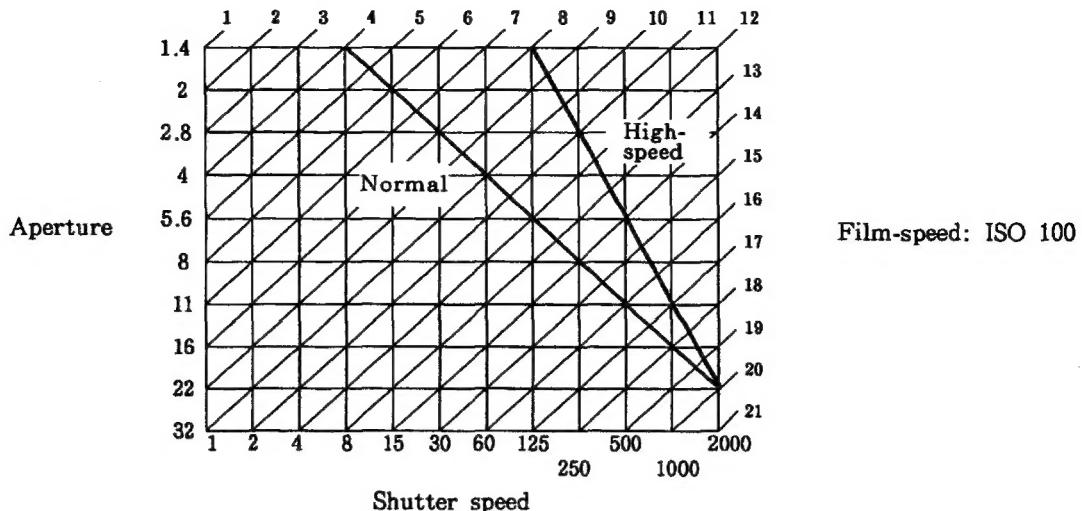

Focusing range: Approx. $\pm 150 \mu\text{m}$ within which the correct focus indicator lights up in the viewfinder

AF illuminator photography: When taking pictures in the single servo AF mode under low-light conditions, AF illumination photography becomes possible when the SB-20, 22, 23 or 24 is mounted. With these speedlight units in any mode, including TTL, A or M, with an AF lens mounted, the AF illuminator lights up when the shutter release button is depressed halfway, and autofocus detection takes place and drives the AF lens. The AF illuminator lights up until the in-focus indicator appears. However, the AF illuminator goes out if the subject cannot be correctly focused. When pressing the shutter release button halfway after removing the finger from the shutter release button once, the AF illuminator lights up again.

Exposure control

(1) Programmed exposure mode

One of two programs, i. e. normal or high-speed program, is automatically selected. Set the shutter speed dial to A and the aperture dial to S, and the lens to its minimum aperture. When the lens focal length is shorter than 135mm, the normal program is selected; when it is 135mm or longer, the high-speed program is selected. The correct exposure LED indicator in the viewfinder lights up when the exposure is correct.

Film-speed: ISO 100

(2) Shutter-priority exposure mode

After setting the lens to its minimum aperture, the aperture dial to S, and the shutter speed dial to a particular speed (1, 2, ... 2000), press the shutter release button. Depending on the film speed, the aperture is automatically controlled to the optimum exposure to match the shutter speed and the brightness of the subject. When the correct exposure is obtained, the correct exposure LED indicator in the viewfinder lights up.

(3) Aperture-priority exposure mode

After setting the lens to its minimum aperture, the shutter dial to A, and the aperture dial to a particular aperture (•, 1.4, •, 2 ... 32), press the shutter release button. Depending on the film speed, the shutter speed is automatically controlled to the optimum exposure to match the aperture and the brightness of the subject. (The dots on the aperture scale indicate half f/stops.) When the correct exposure is obtained, the correct exposure LED indicator in the viewfinder lights up. The shutter speed is controlled continuously within the range of 1 to 1/2000 seconds.

(4) Manual exposure mode

After setting the lens to its minimum aperture, the shutter dial to a particular speed (1, 2, ... 2000), and the aperture dial to a particular aperture (•, 1.4, •, 2, ... 32), depress the shutter release button halfway. Depending on the film speed and the brightness of the subject, one of the following indications appears.

1. Correct exposure: LED correct exposure indicator in the viewfinder lights up.
2. Overexposure : LED overexposure indicator lights up.
3. Underexposure : LED underexposure indicator lights up.

When pressing the shutter release button after setting the shutter speed dial to B, the camera enters the electronically-controlled bulb mode and the LED exposure indicators go out.

(5) Program flash mode

When taking photographs in P or S exposure mode under conditions of lower than BV5, after mounting an AF lens, setting the built-in flash or external flash units (SB-15, 16B, 18, 20, 22, 23 or 24) to the TTL mode, and setting the aperture to the minimum, the quantity of light can be controlled to the optimum preset aperture value for the film speed and then TTL flash control is executed.

Immediately after the built-in flash is raised or the power of an external flash is turned on, the shutter speed will be set to 1/100 sec. automatically.

(However, when the shutter speed is set at B or 1~1/60 sec. in the S mode, the shutter speed is set as is.)

(6) Daylight flash mode

When taking photographs in P or S exposure mode with the background brighter than BV5, after mounting an AF lens, setting the built-in flash or external flash unit (SB-15, 16B, 18, 20, 22, 23 or 24) to the TTL mode, and setting aperture to its minimum, the quantity of light can be controlled to its optimum preset aperture value for the film speed and the intensity of backlighting on the subject. Then, TTL flash control is executed. The shutter speed is controlled at 1/100 sec. automatically. (However, when the shutter speed is set at B or 1~1/60 sec. in the S mode, the shutter speed is set as is.)

(7) Auto exposure control in program flash mode

a) With the following combinations, after selecting the optimum aperture, the flash output is controlled in the TTL mode.

Flash unit : SB-15, 16B, 18, 20, 22, 23 or 24

(speedlight provided with TTL mode)

Lens : New AF Nikkor lens

Exposure mode: P or S mode

The above function is called Program Flash mode (SBP).

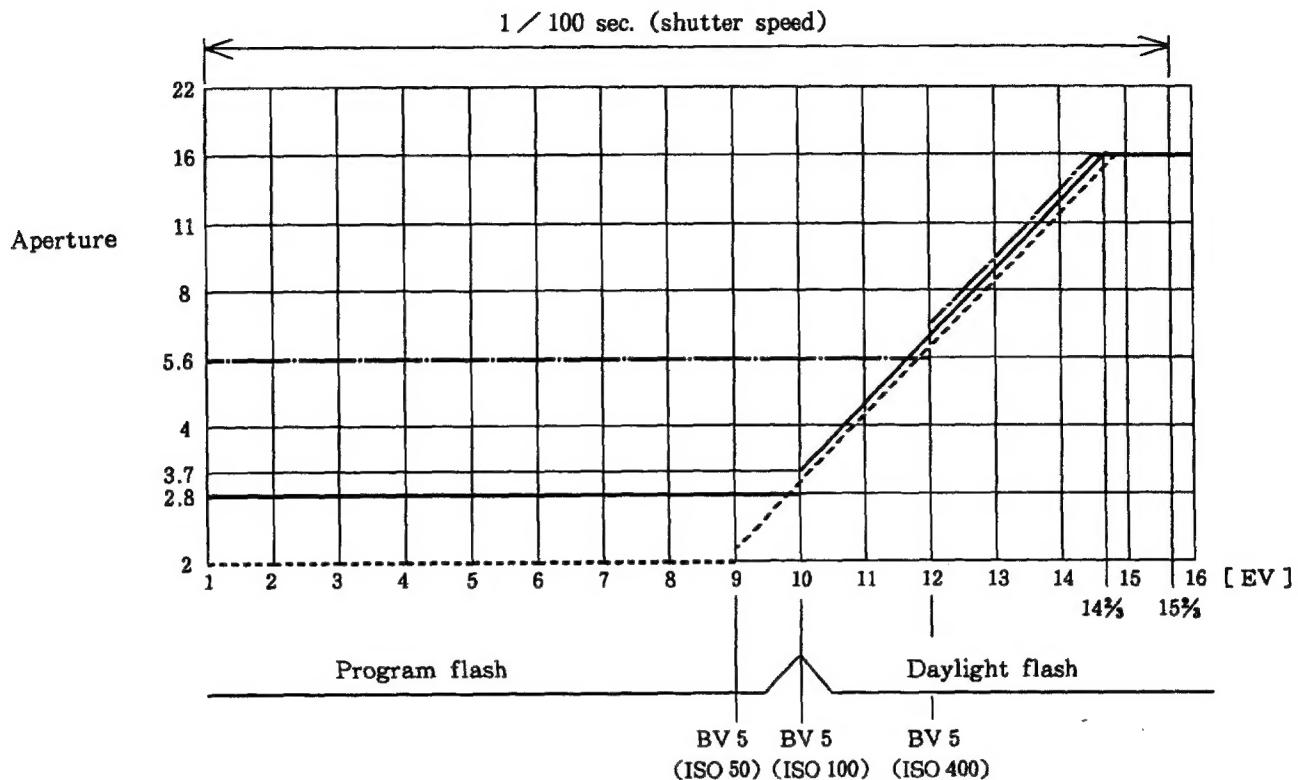

b) The aperture is controlled by position controller which counts the number of pulses after the aperture coupling lever moves. The aperture control value varies according to the ISO film speed and the maximum aperture of the lens. Refer to the following aperture value. (The TTL mode is possible up to ISO 400.)

ISO		25	50	100	200	400	800	1600
F/No.	Built-in flash	1.4	2	2.8	4	5.6	8	11
	External flash	2.8	4	5.6	8	11	16	22

The aperture value varies by 1/3EV step of the ISO film speed. (If the F number of the lens is lower than the above value, the aperture is set to the maximum aperture.)

(8) The aperture value of the program flash and daylight flash modes

Exposure in the P mode is controlled as shown in the figure below:

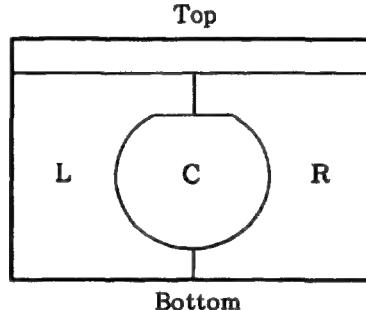

In A mode, the aperture is set to a default value and the shutter speed is controlled at 1/100 sec. In M mode, the aperture is set to a default value and the shutter speed is controlled to a speed under 1/100 sec.

- _____ : ISO 100, built-in flash, AF 50mm F1.8
- : ISO 50, built-in flash, AF 50mm F1.4
- _____ : ISO 400, built-in flash, AF 35~105mm F3.3~4.5
(Flash use indicator does not appear between EV10~12 at ISO 400)

Light measurement: (1) Maximum aperture light metering system
 (2) Special SPD for multiple light metering
 (3) A light sensor for TTL flash control is mounted under the mirror.
 (4) Multi pattern light metering

Usually the correct exposure is calculated according to the light metering value divided into three areas of the picture as shown in the figure below in the P, S or A mode. In the daylight flash mode, backlight and flash illumination can be controlled according to the light metering output calculated by Nikon's triple-sensor metering system as shown in the figure below. In the M mode or when the AEL button is depressed, the light metering value is controlled by the light metering output calculated at the center area.

Metering range: EV1 ~ EV19 (ISO 100, F1.4 lens used)

Exposure meter: Three LED indicators in the viewfinder light up when the shutter release button is depressed halfway or the pre-release timer is activated.

Film speed setting: Automatic (ISO 25 ~ 5000)

When using a DX-coded film, the film speed is automatically set by reading the CAS code printed on the film cartridge. With non-DX-coded film, the film speed is automatically set to ISO 100.

Auto exposure lock: (1) When depressing the AEL button on the front cover, the center-weighted metering value is stored and exposure is controlled based on that value.
 (2) AE lock is effective only while the shutter release button is pressed lightly. The power does not turn off while the AEL button is depressed.
 (3) When using flash, AE lock is automatically cancelled. But if the AEL button continues depressed for the next non-flash shot, the exposure is controlled to the before-locked value.
 (4) When the AEL button is depressed in the M mode, the exposure metering value is locked. But the shutter speed and aperture value are set to default values.

Viewfinder:

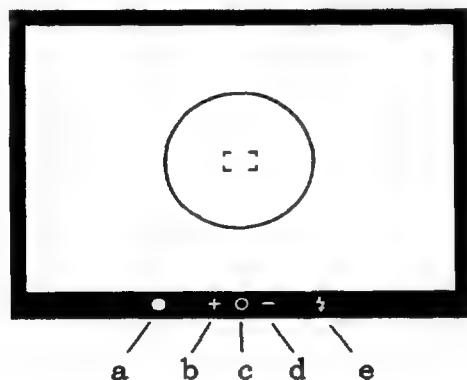

- (1) Eye-level viewfinder with pentaprism
- (2) Screen: Type B (matt surface) clear matt with focus brackets
- (3) Quick return mirror: half mirror with 30% transmission (without mirror-up device)
- (4) Viewfinder coverage: 92% (vertically/horizontally)
- (5) Viewfinder magnification: 0.8× (with 50mm lens at infinity)
- (6) Viewfinder diopter: -1 dpt. (visual field), -1.8 dpt. (display)

Eyepiece:

- (1) Square type (FG type)
- (2) Eyepiece correction lens and rubber eyecap available
- (3) Eyepiece magnifier with eyepiece adapter (23FAPN) available

Viewfinder display:

- (1) Three LED exposure indicators
 - b. Red LED overexposure indicator
 - c. Red LED correct exposure indicator
 - d. Red LED underexposure indicator
- (2) Flash indicator
 - e. Red LED flash ready-light indicator
- (3) Focus indicator
 - a. Green LED in-focus indicator

Indicators and warning in the viewfinder

AF indicator and warning

- (1) The green LED focus indicator lights up in both auto and manual focus modes when the correct focus is obtained (while depressing the shutter release button halfway in A mode or while pre-release timer is activated in M mode).
- (2) The green LED focus indicator goes out in both A and M modes, and the shutter release is locked in the A mode while the lens is focused in front of or behind the subject.
- (3) The green LED focus indicator blinks and the shutter release is locked in the A mode when the focus detection is impossible. (due to low light intensity or low contrast)

Exposure indicators and warnings

- (1) In P, A or S mode
 - a) The red LED exposure indicator (○) lights up when correct exposure is obtained in the P, A or S mode.
 - b) The red LED exposure indicator (○) blinks at a frequency of 2Hz to warn of possible picture blur when the shutter speed is $1/30$ sec or slower in the A or P mode. (In the S and M modes, no warning indicator appears.)
 - c) The red LED overexposure (+) or underexposure (-) indicator lights up and the shutter release is locked when the shutter speed and aperture value are not within the available range of the subject brightness and/or ISO film speed.
 - d) While depressing the AEL button, light metering is automatically shifted from multi-pattern metering to center-weighted metering, and the exposure is locked in this state.
 - e) In the A mode, when the aperture is set beyond the lens minimum or maximum aperture, the aperture is controlled to the minimum or maximum of the lens in use. No warning indicator is displayed.
 - f) In the S mode, the shutter release is locked when the shutter dial is set to B and the indicators go out.
- (2) In M mode
 - a) If the exposure value set in the M mode is within the range of $\pm 1/3$ EV for the optimum exposure value, the red LED exposure indicator (○) lights up.
 - b) If the exposure value set in the M mode is between the range of +1EV and $+1/3$ EV for the optimum exposure, the red LED correct (○) and overexposure (+) indicators light up simultaneously.
 - c) If the manually set exposure value is between $-1/3$ EV and -1EV for the correct exposure, the red LED correct exposure indicator (○) and underexposure indicator (-) both light up.
 - d) When the light intensity is beyond the camera's exposure metering range, or manually set exposure value is not within ± 1 EV for the correct exposure, one of the overexposure (+) or underexposure (-) indicator lights up.
 - e) When the shutter speed dial is set to B, the AE indicator goes out.
 - f) When the aperture dial is set beyond the lens minimum or maximum aperture, the actual aperture is set to the minimum or maximum aperture of the lens in use, respectively.

Flash ready-light indicator and warning

- (1) When both built-in and external flashes are off and when the camera determines that the flash is necessary (for daylight flash or low light), the LED ready-light indicator (⌚) in the viewfinder blinks when the shutter release button is depressed halfway. (However, the LED ready-light indicator does not blink for daylight flash in the M mode.)
- (2) When the flash is turned on and fully recycled, the LED ready-light indicator (⌚) lights up when the shutter release button is depressed halfway. If the background is darker than EV10, the LED exposure indicators do not light up.
- (3) When the flash (either built-in or external) fires at full output, the LED ready-light indicator (⌚) blinks for two seconds to indicate the full flash firing.
- (4) When the camera selector of the SB-E and the SB-19 is set to EM or B, and for the TTL flash control, the LED ready-light indicator (⌚) blinks.
- (5) When both built-in and external flashes are on, the built-in flash takes precedence and displays indicators (1 through 4 above) depending on the conditions of the built-in flash.

Others

- (1) When a lens other than a new AF lens (one without AF contacts) is mounted or no lens is mounted, the in-focus indicator does not light up, but the LED exposure indicators and LED flash ready-light can still light up and shutter release is also possible. (However, when the shutter speed dial is set to A, the shutter release is locked.)
- (2) When the ring of the lens is not set to the minimum aperture, both the overexposure (+) and underexposure (-) indicators blink alternatively, and the shutter release button is locked. (effective only when a lens with AF contacts is mounted)

Table of viewfinder indicators and warning

		○ Green	+ ○ - Red	◆	Remarks
AF	1. In focus 2. Front focus or Rear focus 3. Focusing is impossible	Lights up Goes out Blinks			A: While the shutter release button is depressed halfway M: For 8 seconds A: Shutter release is impossible M: Shutter release is possible A: Shutter release is locked and indicator is displayed while the shutter release button is depressed halfway M: Shutter release is possible and indicator goes out
AE	1. AE control is possible (high speed) 2. AE control is possible (but possible picture blur) 3. Above AE metering range 4. Below AE metering range 5. M mode ($\pm 1/3$ EV) 6. M mode (+1EV ~ +1/3EV) 7. M mode (-1/3EV ~ -1EV) 8. M mode (above light metering range, over +1EV) 9. M mode (below light metering) 10. AE lock 11. Set to bulb		○ lights up ○ blinks + lights up - lights up ○ lights up + ○ light up ○ - light up + lights up - lights up + ○ - go out + ○ - go out		Always appears in S mode In A and P modes Shutter release is locked Shutter release is locked Shutter release is not locked Shutter release is not locked Shifts to center-weighted metering
SB (only while shutter release button is depressed halfway)	1. Flash indication 2. Completion of recycling 3. Full flash warning 4. External flash setting is not correct 5. Built-in flash is recycling 6. External flash is recycling 7. Both built-in and external flashes are on			Blinks Lights up Blinks Blinks Goes out Goes out	Low light (under EV10), daylight flash (over BV5) (flash power off prior to shooting) AE indicator goes out when flash is on in low light (For daylight flash in P, S or A mode, AE indicators light.) After shooting Prior to shooting, flash power is on Shutter release is locked Shutter release is not locked Built-in flash works
Others	1. Warning for incorrect minimum aperture setting 2. Film end		+ - blink alternately		Shutter release is locked Self-timer LED lights up

**Sequence error
warnings:**

Safety measures to prevent sequence errors (LED self-timer indicator lights up for 8 seconds, and goes out when the shutter dial is set to L.)

(1) Aperture control by reserve motor rotation is not completed in a certain period of time.

When no mirror SW signal is received within 200ms after the shutter is released (after the motor starts rotating in the reverse direction), the motor is braked, and rotated in the normal direction until the film advance SW turns on, then again braked and stopped.

(2) The film advance and mirror-down operations by normal motor rotation are not completed within a certain period. The motor is braked and stopped if the film advance completion SW signal is not input in 10ms after the closing shutter curtain Mg is turned off following shutter release (or in approx. 1 sec after the motor starts rotating in the normal direction).

(3) If the mirror remains in the "up" state after the previous shutter release operation (for instance, when the power is turned off while making long time exposures), the motor is forced to rotate in the normal direction, then braked and stopped when the camera detects that the mirror SW turns on after shutter release.

(4) If the mirror stops while it is going back down after the previous shutter release operation (or when film advance stops before it is completed; for example, when film advance becomes impossible because the film is advanced to the end of roll), the motor is forced to rotate in the normal direction until film advance SW turns on, then braked and stopped when the camera detects that the film advance completion SW is off; the self-timer LED indicator also lights up.

(5) Film advance completion SW failure

If the film advance completion SW is on when the mirror starts moving down (or the motor starts rotating in the normal direction), the motor does not rotate in the normal direction.

(6) Mirror SW failure

In the same condition of the item 1 or after shutter release, if the camera detects that the mirror SW and film advance completion SW turn on, the motor does not operate (neither in normal nor reverse direction.)

Pre-release SW: (1) By depressing the shutter release button halfway, the switch is turned on and light metering continues for 8 seconds after removing the finger from the shutter release button.
 (2) Light metering continues for approx. 2 seconds after removing the finger from the shutter release button.
 (3) With the built-in flash in the raised position, the pre-release timer operates until recycling is completed. During this time, indicators are displayed and light metering continues.

Shutter release: (1) By depressing the shutter release button fully, the release SW is turned on and the motor starts to activate the shutter release operation.
 (2) When an AF lens is mounted and the AF mode is selected, shutter release is possible only when correct focus is obtained.

Film loading: Built-in easy film loading system (normal film advance) is employed. When depressing the shutter release button fully after pulling the film leader out to red index mark and closing the camera back, the frame counter turns to "1" after advancing three or four blank frames, then stops. During this operation, the mirror moves up for each frame, and the shutter curtains do not open.

Film advance: (1) Automatic film advance by built-in motor
 (2) Self-timer LED indicator lights up for eight seconds at the end of the roll. (The indicator lights up repeatedly when the shutter release button is depressed once again.)

Frame counter: Automatically returns to the S position.

Film rewinding: (1) Auto film rewinding with built-in motor
 (2) By sliding the film rewind lever located behind the top cover and by pushing the rewind button, the film rewind switch turns on and film rewinding begins.
 (3) While the film is rewinding, the frame counter counts down. (This does not occur when there is no film in the camera.)
 (4) After completion of rewinding, the rewind button returns to its original position and the motor stops automatically.

Self-timer: (1) Electronically controlled
 (2) After depressing the self-timer button on the top cover, the camera enters the pre-release state and the shutter is released in approx. 10 seconds.
 (3) If the self-timer button is depressed again within 10 seconds, the self-timer operation is cancelled.
 (4) The LED self-timer indicator blinks at 2Hz for the first 8 seconds, then at 8Hz for the last 2.

- (5) If the shutter release button is depressed fully while the self-timer is operating, the shutter can not be released. In other words, the self-timer operation takes precedence.
- (6) In self-timer operation, the AF lens is not driven unless the release button is depressed halfway.

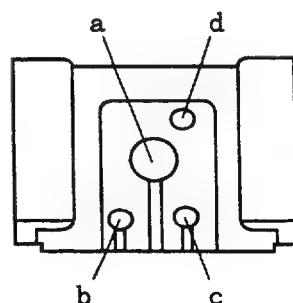

Built-in TTL flash:	(1) Guide number	12
	(2) Parallel control system	
	(3) Angle of coverage	35mm lens or longer
	(4) Flash recycling time	Approx. 4.5 sec (fresh alkaline batteries at normal temperature)
	(5) Flash ready indicator	LED flash ready-light lights up in viewfinder.
	(6) Number of flashes	More than 8 rolls of 36-exposure film (with fresh alkaline batteries at room temperature)
	(7) Pop up	Manual
	(8) Built-in flash cannot be used simultaneously with external flash.	Built-in flash takes precedence.

Flash synchronization:

- (1) X-contact only (synchronization under 1/100 sec)
- (2) No sync terminal
- (3) When using Nikon dedicated electronic flashes (SB-15, 16B, 18, 20, 22, 23 or 24)
 - a) The flash ready-light in the viewfinder lights up when recycling is completed while power is on.
 - b) In the P or A mode (or the S and M modes with a shutter speed faster than 1/125 sec), the shutter speed is automatically set to 1/100 sec immediately after the flash is turned on. When the shutter speed is set to 1/100 sec or less in the S or M mode, the shutter speed is set as is.
 - c) The LED flash ready-light in the viewfinder blinks for 2 seconds after shooting when the flash fires at full power.
 - d) The LED flash ready-light blinks when the film speed is set beyond the acceptable film speed range (over ISO 400)
 - e) The LED flash ready-light lights up or blinks only while the shutter pre-release timer is operating.
 - f) The flash does not fire until the frame counter indicates "1".

Accessory shoe: The following four contacts are provided.

- a) Flash contact
- b) Ready-light contact
- c) TTL light metering contact
- d) Monitor contact

Power supply: Four AA-type alkaline-manganese batteries, four high-grade AA-type manganese batteries, or four AA-type Ni-Cd batteries can be installed in the battery chamber.

Checking battery power:

(1) Normal	Shutter pre-release timer is activated for approx. 8 seconds.
(2) Insufficient	Shutter pre-release timer is activated for approx. 2 seconds
(3) No power	No viewfinder LED exposure indicator lights up, shutter release is locked, and AF lens servo is locked.

△ Current consumption:

(1) For light metering and distance detection (AF lens attached, power 6V with resistor 0.8Ω)	150mA MAX
(when depressing the shutter release button halfway)	
(2) For driving the AF lens	Approx. 280mA
(3) For shutter release operation (when providing Mg with voltage)	Approx. 1.25A
(4) For advancing the film (average)	Approx. 620mA
(5) For rewinding the film	Approx. 420mA
(6) For using built-in flash	9000mAsec/1F
— These values are to be measured at room temperature —	
(7) Power off	10 μA MAX

Camera back:

(1) Non-detachable	
(2) Film cartridge confirmation window and film advance indicator are provided. (No memo holder)	
(3) Open the camera back by sliding the camera back open lever downward.	

Tripod socket: U 1/4 inch

Temperature for use:

(1) For normal function	-10 °C ~ 40 °C
(2) For actual shooting	-20 °C ~ 40 °C
(3) For storage	-30 °C ~ 60 °C

Dimensions: 153.9 (W) × 102.15 (H) × 65.58 (D) mm

Weight:

(1) Approx. 650 g (without data back; FAA21052, FAA21152)	
(2) Approx. 655 g (With data back; FAA21252)	

Number of 36-exposure film rolls per set of fresh batteries (approx.)

(For autofocus operation with AF Nikkor lens covering the full range from infinity to the closest distance and back to infinity before each shot)

Battery		With AF 50/1.8		With AF 35~70/3.3~4.5	
		Room temp.	- 10 °C	Room temp.	- 10 °C

3. DATA BACK (for FAA21252)

Usable film speed and film speed setting

- (1) ISO 64 ~ 1600
- (2) Imprinting time is automatically selected out of three steps according to the ISO film speed set at the camera body.
Correct imprinting time may not be available if the film speed is outside the usable range.
- The film speed of a non-DX coded film regarded as ISO 100.

ISO	Imprinting time
64 ~ 80	Approx. 100msec
100 ~ 320	Approx. 58msec
400 ~ 1600	Approx. 25msec

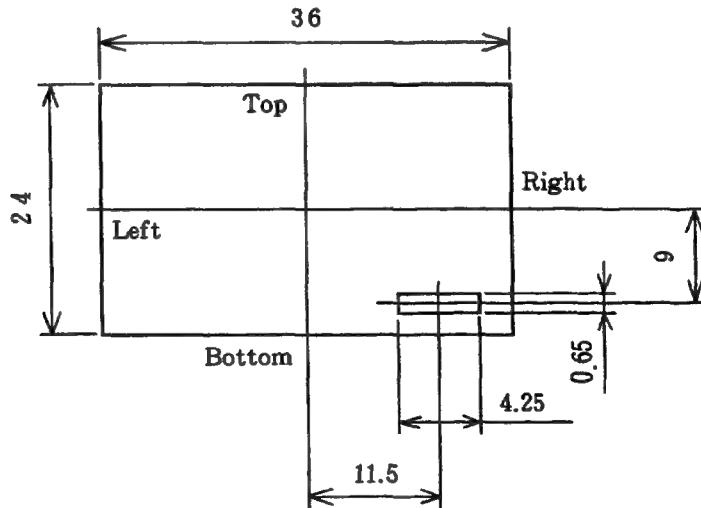

Imprinting method: Imprint data are displayed on the LCD panel

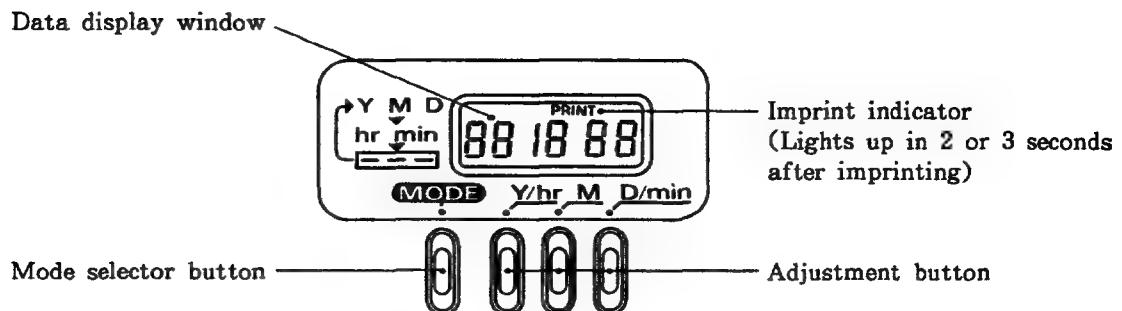

Imprint data:

- (1) Calendar (Year/Month/Day; Arrangement cannot be changed.)
- (2) Clock (Hour/Minute; 00:00 ~ 23:59)
- (3) No imprint

* The calendar is automatically adjusted up to 2019.

Imprinting position:

External LCD display and operational button

Signal contact Following two contacts are provided.

(for transmission to camera body):

- a) Imprint signal
- b) GND

Clock accuracy: Approx. ± 90 sec/month (at 20 °C)

Power source: 3V lithium battery (CR2025) $\times 1$

Battery life: Approx. 4 years

Temperature for use:

(1) For normal function	-10 °C \sim 40 °C
(2) For actual shooting	-20 °C \sim 40 °C
(3) For storage	-30 °C \sim 60 °C

1. Adjustment of F-401s/N4004s

F-401s/N4004s cameras are almost the same as F-401/N4004 mechanically and electrically. Therefore, refer to Repair manual of F-401/N4004 for the mechanical and electrical adjustment. Also, adjustment program for F-401/N4004 can be used.

Note: ① Before adjustment of accuracy after replacing main FPC or EEPROM, make sure that data in EEPROM are the ones for F-401s/N4004s.

(Refer to page E0 4/5.)

② Please refer to the following sections as to the compatibility of parts.

2. Difference between parts for F-401s/N4004s and those for F-401/N4004

(1) Part numbers for each model

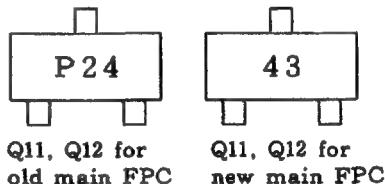

F-401 N4004	Main FPC	Shutter	AF FPC
	1B990-276 CPU version 1.0/1.1/1.3/1.4/1.A	1B990-278	1B990-277

F-401s N4004s		Main FPC	Shutter	AF FPC
	Initial products	1B990-276 CPU version 1.A	1B990-278	1B999-274
	Others	1B990-276-1 CPU version 1.A	1B990-278-1	1B999-274

(2) Difference of parts

	Main FPC	Difference
F-401 (N4004)	1B990-276	<ul style="list-style-type: none"> * Five kinds of CPU version exist. (1.0/1.1/1.3/1.4/1.A) * EEPROM data are for F-401/N4004.
F-401s (N4004s)	1B990-276	<ul style="list-style-type: none"> * Used in the initial products. * Same as main FPC for F-401/N4004 basically. CPU version is 1A. (If CPU version is other than 1A, the main FPC cannot be used in F-401s/N4004s) * EEPROM data are for F-401s/N4004s.
	1B990-276-1	<ul style="list-style-type: none"> * Used in other than initial products. * Shutter Mg control transistors Q11 and Q12 on main FPC has been modified. CPU version is 1.A. * EEPROM data are for F-401s/N4004s.

① Identification of new and old FPC's (1B990-276, 1B990-276-1)
Print on shutter Mg control transistors (Q11, Q12) is different as shown in the figure.

② Refer to page E3 for the location of the transistors Q11 and Q12.

③ No adjustment is made to the main FPC's (1B990-276) supplied to you from Parts Control Section. It is necessary to check the data in EEPROM when replacing main FPC and adjusting accuracy. (Refer to page E0 4/5.)

	Shutter	Difference
F-401 (N4004)	1B990-278	<ul style="list-style-type: none"> * Used in F-401/N4004 from the beginning. * Usable in F-401s/N4004s. (Usable with main FPC 1B990-276 and 1B990-276-1)
F-401s (N4004s)	1B990-278	<ul style="list-style-type: none"> * Used in the initial products. * Basically same as the shutter of F-401/N4004. * Usable with main FPC 1B990-276 and 1B990-276-1
	1B990-278-1	<ul style="list-style-type: none"> * Used in other than initial products. * Zener diode on shutter base plate has been discarded. * To be used in combination with main FPC 1B990-276-1. When using with 1B990-276, it is necessary to replace shutter Mg control transistors Q11 and Q12 on main FPC with new one.
Identification of new and old shutter		
		Identified by the color of mark (xxxx).
Black : Old type 1B990-278 White: New type 1B990-278-1		

3. EEPROM data (Comparison between F-401s/N4004s and F-401/N4004)

Address		Name/Function	F-401 N4004					F-401s N4004s
			CPU version					
			1.0	1.1	1.3	1.4	1.A	1.A
1	UPPER	AF GAIN	154	154	138	138	138	161
	LOWER		0	0	0	0	144	160
2	UPPER	L 1	Write in when adjusting AF. (ΔZ)					
	LOWER	L 1						
3	UPPER	CCD CHG/WAIT GAIN	31	31	31	31	31	0
	LOWER	AF AGC Level	128	128	128	128	128	128
4	UPPER	AE Level (L)	Write in when adjusting AE.					
	LOWER	AE Gammer						
5	UPPER	AE Level (C)	Write in when adjusting X BER P.					
	LOWER	X BER P						
6	UPPER	AE Level (R)	Write in when adjusting AE					
	LOWER	1/2000 Adjustment						
7	UPPER	TTL Adjustment	Write in when adjusting TTL.					
	LOWER	CCD Off Set	0	0	0	0	0	0
8	UPPER	B.C. 1	Write in when adjusting B.C.					
	LOWER	B.C. 2						
9	UPPER	Aperture Mg Off Set	*1					
	LOWER	DSL Brightness Difference	0	0	0	24	24	24
10	UPPER	Number of Release (Upper)	0	0	Number of release after shipment			
	LOWER	Number of Release (Lower)	0	0				
11	UPPER	AF Slope	0	0	56	56	56	56

12	UPPER	AGC Level	0	0	0	0	100	100
	LOWER	AGC Level	0	0	0	0	30	30

Usage of EEPROM

Address 1 ~ 12 : For adjustment

Address 25 ~ 27 : For service

Address 28 ~ 32 : For assembly line

*1: Aperture Mg resistor value and EEPROM data

Aperture Mg resistor value	External parts	EEPROM data
55Ω	No part	100
55Ω	Diode	130
55Ω	Resistor	110
100Ω	No part	135

4. Compatibility and necessary modification to use the following parts in F-401s/N4004s and F-401/N4004

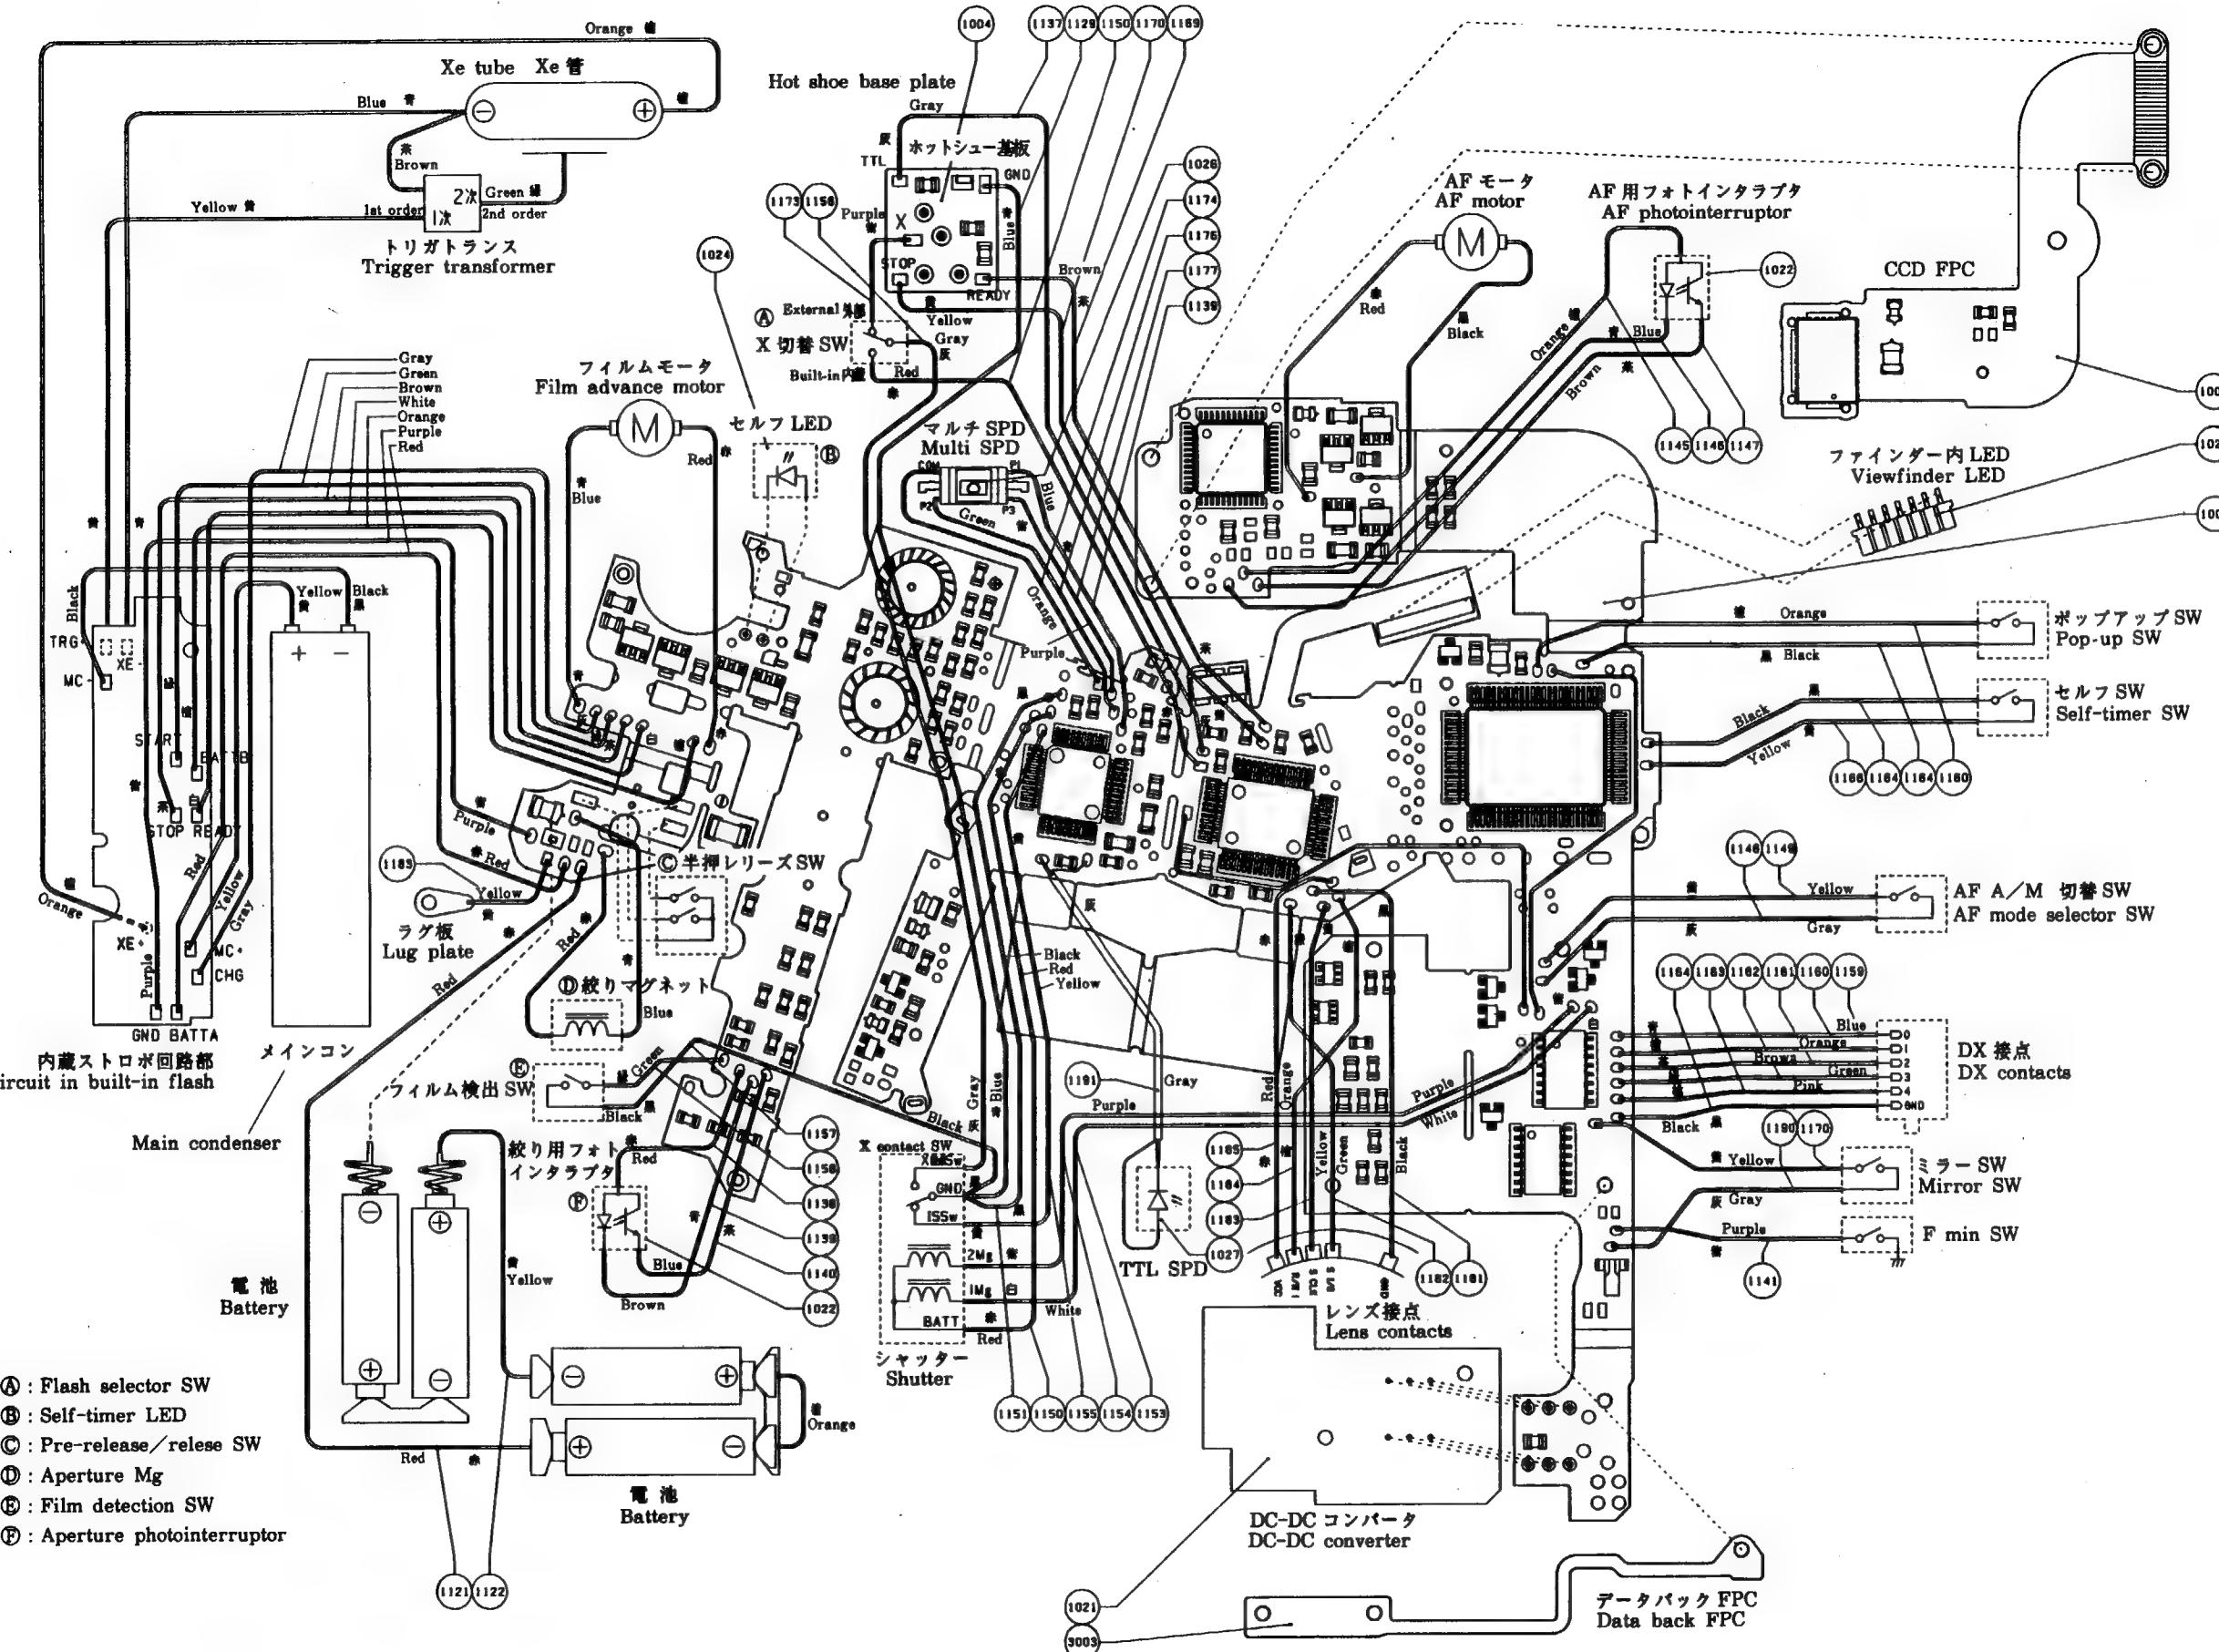

Note: ① Check main FPC to see if an F-401s camera is a initial product or not. Refer to page E0 2/5 for distinction of new and old main FPC's (1B999-276, 1B990-276-1)

② As no distinction is mode to the main FPC supplied by parts Control Section (not described whether it is for F-401s or F-401), it is necessary to check EEPROM data when replacing main FPC and adjsuting accuracy. (Refer to page E0 4/5 for the EEPROM data.)

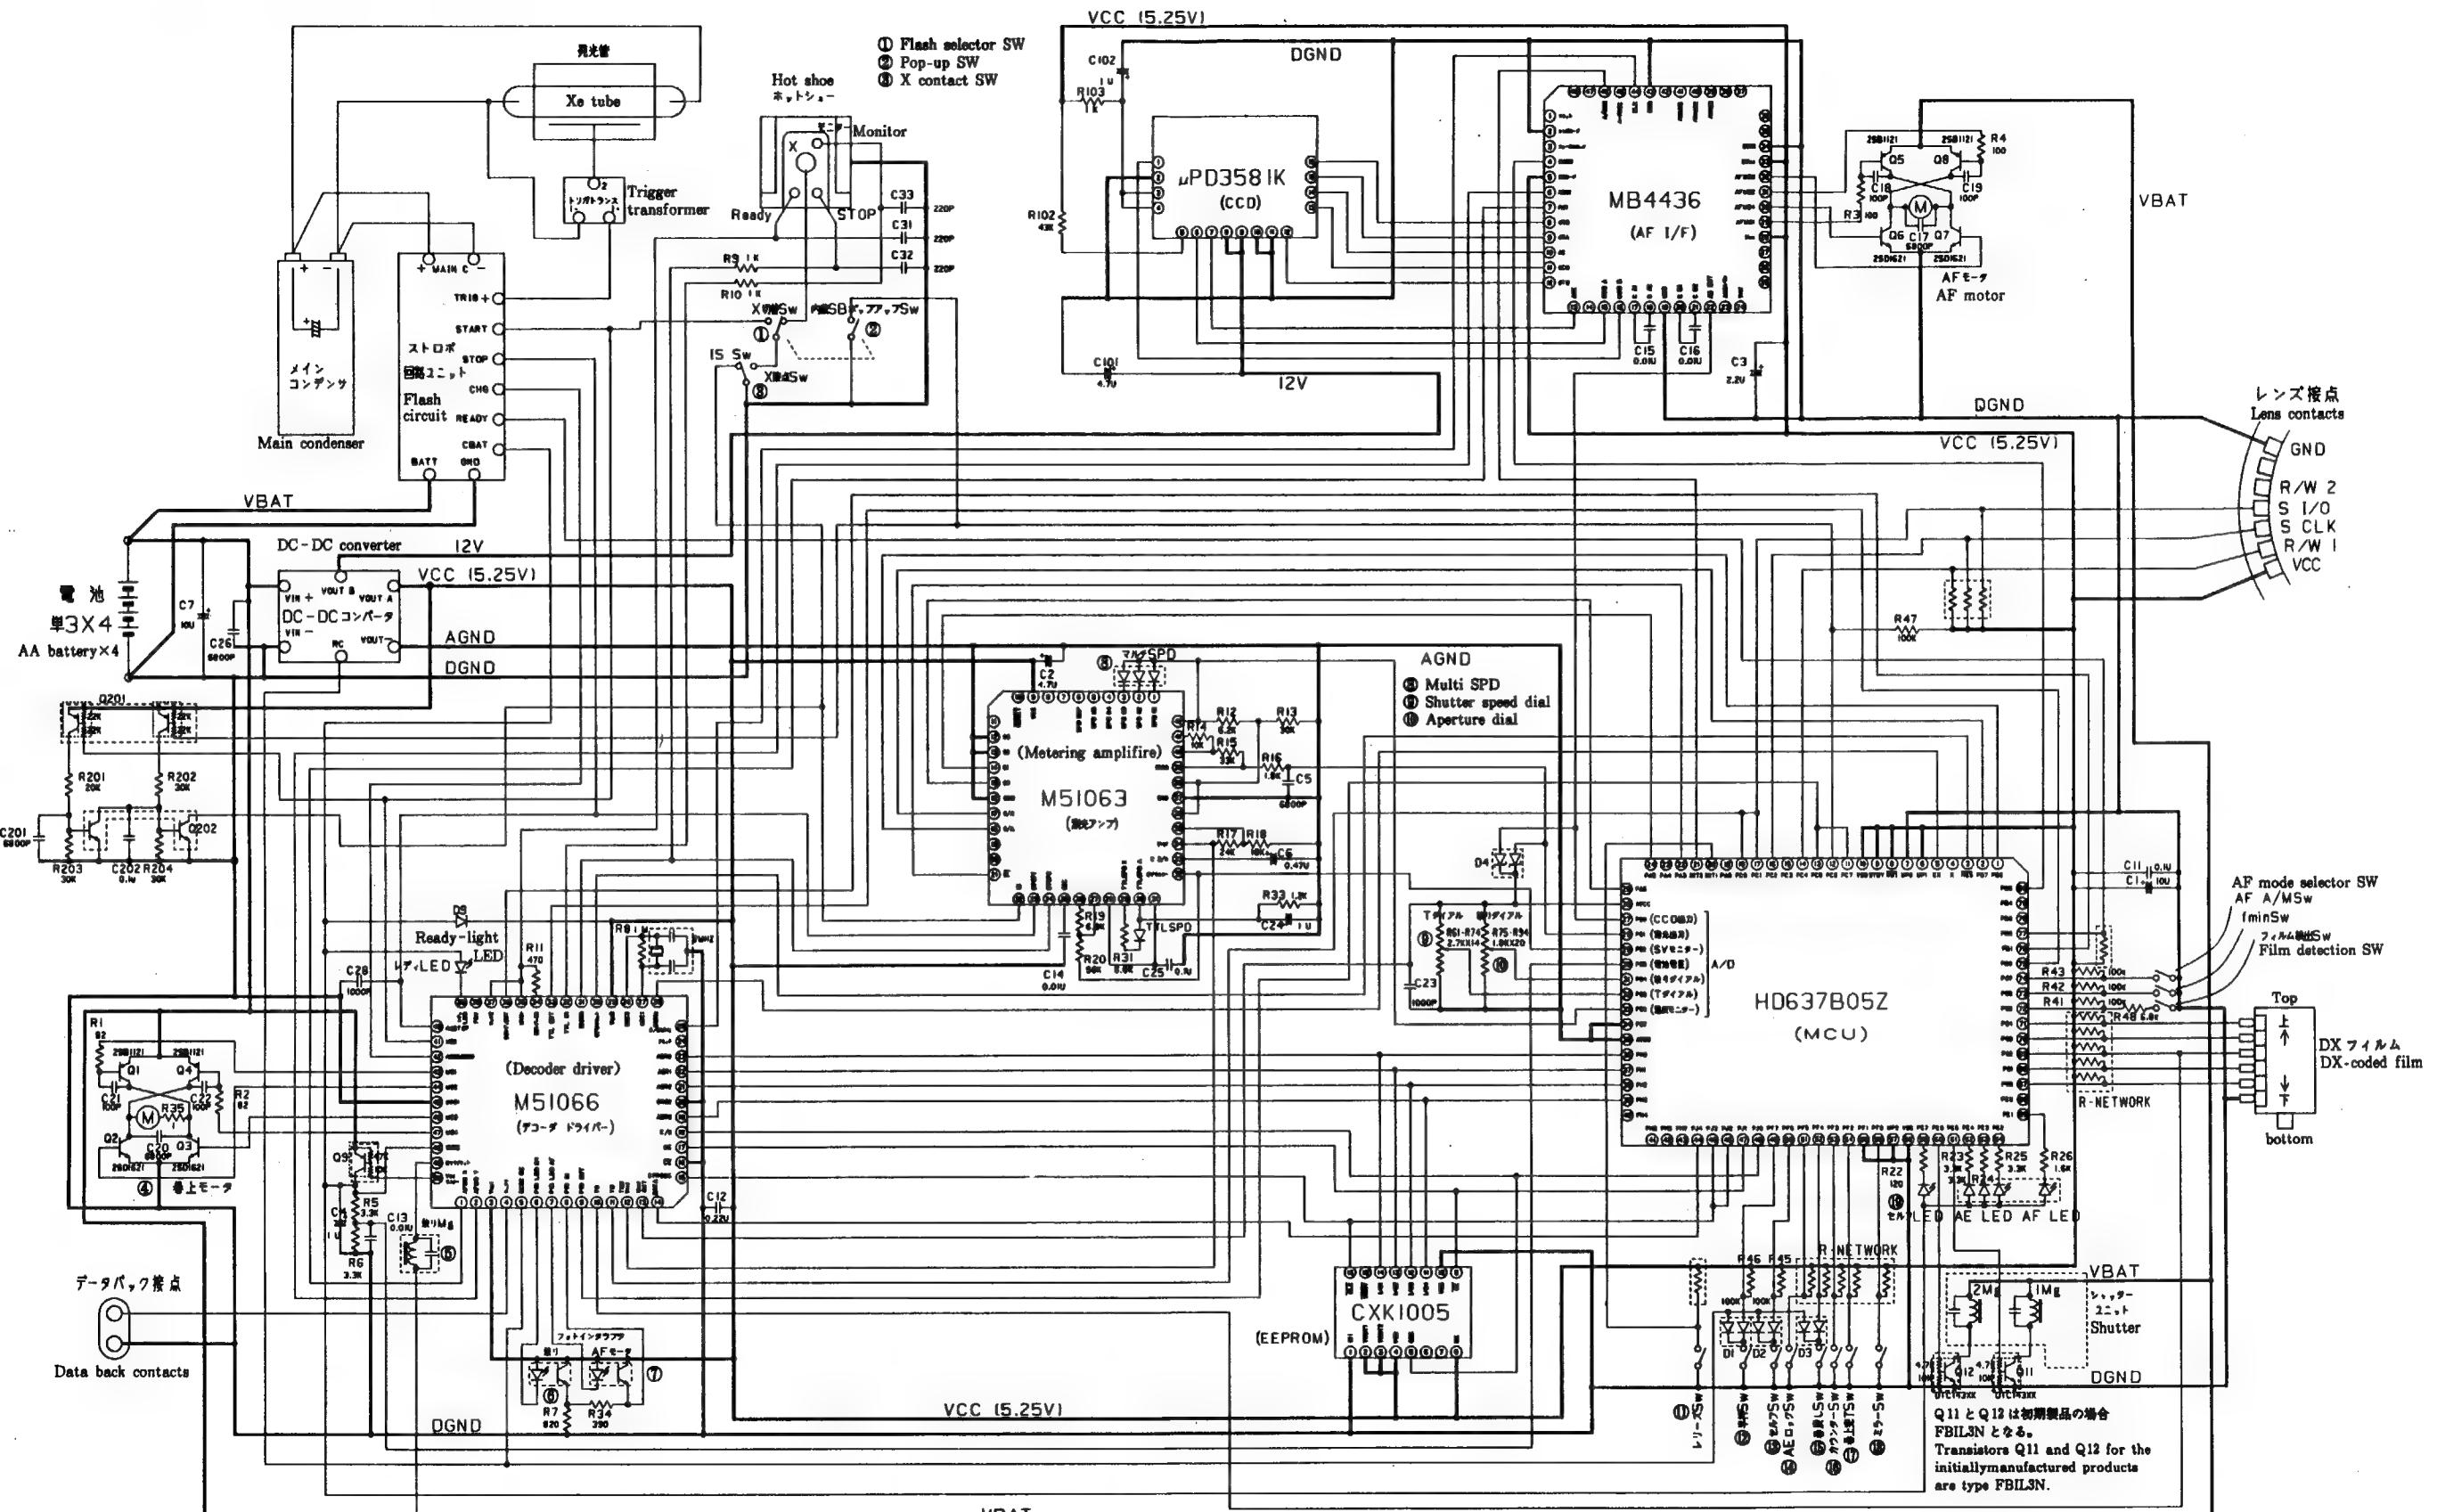

③ Refer to page E3 for the location of shutter Mg control transistors Q11 and Q12 mounted on main FPC.

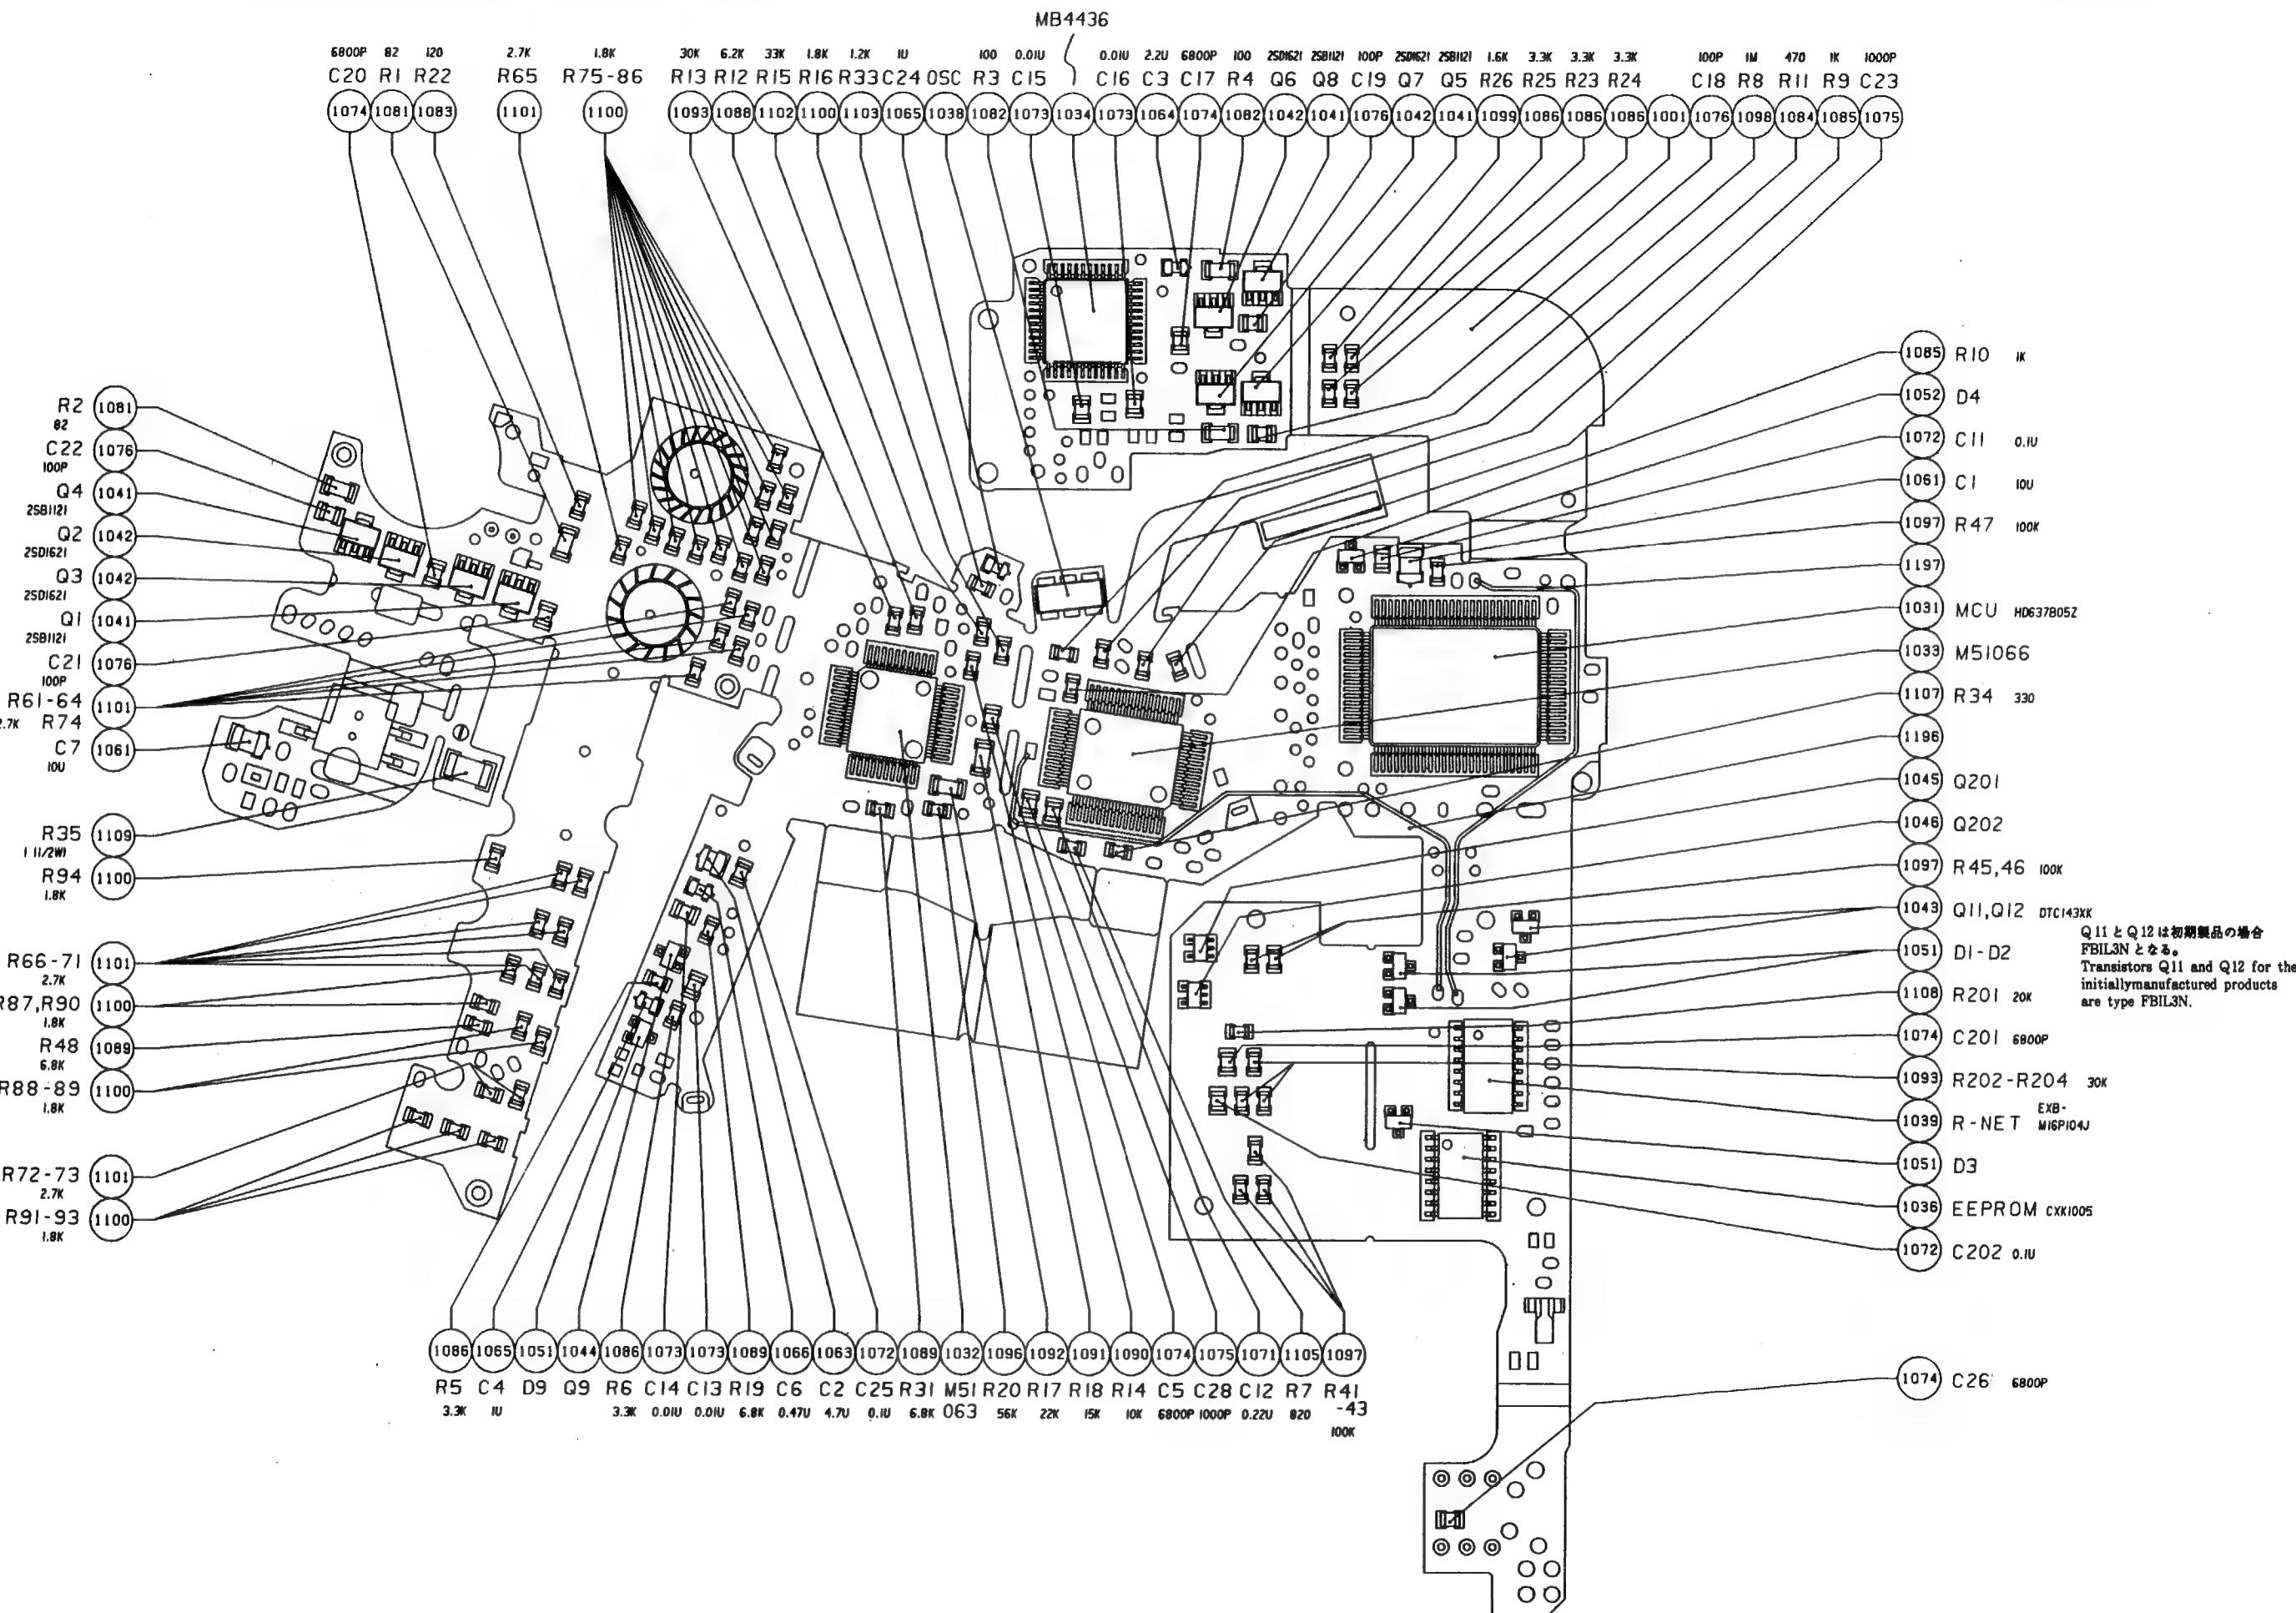

Part to be replaced			Main FPC		Shutter		AF FPC			
			1B990-276-1 For F-401s/N4004s	1B990-276 For F-401s/N4004s and F-401/N4004	1B990-278-1 For F-401s/N4004s	1B990-278 For F-401s/N4004s and F-401/N4004	1B999-274 For F-401s/N4004s	1B990-277 For F-401/N4004		
F-401s N4004s	Initial products	Main FPC 1B999-276	Usable without modification	① CPU version should be 1.A. ② Make sure that EEPROM data are for F-401s/N4004s. (If no, re-write that data.)	Replace Q11 and Q12 on main FPC with new ones (1S135-034).	Usable without modification	Usable without modification	Not usable		
		Shutter 1B990-278
